

側向散射決定光路是否可見；重力決定久置後是否沉降

真溶液

粒徑 $< 1\text{ nm}$

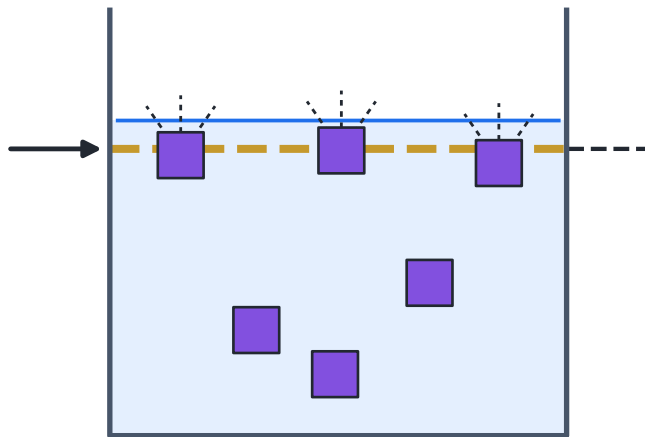

側看：無可見光路

久置：不沉降

膠體

1–1000 nm

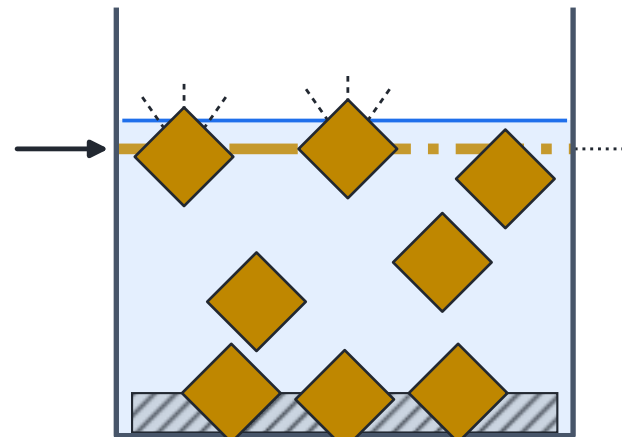

側看：散射使光路可見

久置：通常不沉降

懸浮液

粒徑 $> 1000\text{ nm}$

久置後的底部沉積層

側看：強散射／遮光

久置：形成沉澱
