

排水集氣先用水面高低求瓶內總壓，再扣除同溫的飽和水蒸氣壓

內外水面等高

$$P_{inside} = 755 \text{ mmHg}$$
$$P_{dry} = 755 - 24 = 731 \text{ mmHg}$$

瓶內水面較低 136 mm

$$P_{inside} = 765 \text{ mmHg}$$
$$P_{dry} = 765 - 24 = 741 \text{ mmHg}$$

瓶內水面較高 136 mm

$$P_{inside} = 745 \text{ mmHg}$$
$$P_{dry} = 745 - 24 = 721 \text{ mmHg}$$

$136 \text{ mmH}_2\text{O} = 136/13.6 = 10.0 \text{ mmHg}$ ；水面較低的一側壓力較大
